FULL DESCRIPTION OF SITE (including topography, adjacent land use, boundaries etc.):

A flat site with drains running along the northern and southern boundaries surrounded by grassland to the north and east, housing to the south, and woodland to the west. The site comprises a mosaic of marshy grassland, scrub and tall herb communities.

The marshy grassland including a groups of species associated with transitions between NVC communities MG10 and M23 including marsh bedstraw *Gallium palustre*, sharp-flowered rush *Juncus acutifolius* and greater bird’s-foot trefoil *Lotus uliginosus*. Here rushes, grasses and sedge are tall, tussocky and dominant with scrambling herbs in the understorey. In discrete patches meadow sweet *Filipendula ulmaria*, and hemlock water-dropwort *Oenanthe crocata* dominate the majority of the understorey a possible sign of the abandonment of the field.

Towards the margins of the wetter ground, scrub and tall herbs dominate and there are several mature oaks across the site as well as two relatively small areas of mature broadleaved woodland.

A records exist for otter in the area and such habitat in spite of it’s proximity to housing may provide a suitable resting place for this species. The Wildlife Site selection criteria also identify these habitats as of potential importance to marsh fritillary butterfly and double-line moth.
