WS/SO40/45	Mitchell Troy Common Fields	SO495092	1.80 ha	Neutral Grassland (MG5/ MG6)	Lowland Species-Rich Grassland (HAP)	Two large fields on moderately sloping ground, facing south. Separated by wooded, rocky stream with mature alder running north-south across site. Evidence of an old dwelling and remnant orchard in field 2. The steeper ground on the top sections of both fields was most diverse. The lower parts of both fields were quite rank and tall with frequent bracken invading from field edges. Fields do not appear to be being grazed at present. The boundary (stream) between fields is not stockproof, therefore it is effectively one management unit. The species rich sections were short grazed, (probably rabbit) and comprised locally frequent <i>Lotus corniculatus</i> , <i>Potentilla erecta</i> , <i>Trifolium pratense</i> , <i>Leontodon hispidus</i> and <i>Hypochaeris radicata</i> . Although herb diversity throughout is not especially high the stream and trees are of high wildlife value and fields are being managed favourably.	H4 Neutral Grasslands
